

1.1.1. Calculate Momentum

20:58

Write a program that accepts the mass of an object (in kilograms) and its velocity (in meters per second), then calculates and displays the momentum of the object. The momentum p is calculated using the formula:

$$p = m \times v$$

where:
 m is the mass of the object (in kilograms).
 v is the velocity of the object (in meters per second).

Input Format:
A single floating-point number representing the mass of the object in kilograms.
A single floating-point number representing the velocity of the object in meters per second.

Output Format:
The output will display calculated momentum with appropriate units (kgm/s) (rounded up to 2 decimal places).

Sample Test Cases

calculate...

1 mass=float(input(""))
2 velocity=float(input(""))
3 p=mass*velocity
4 print("%.2f"%p,end="")
5 print("kgm/s")

1.1.2. Conditional Calculation Based on the Number of Digits

15.45

Write a Python program that accepts an integer n as input. Depending on the number of digits in n .

Constraints: $1 \leq n \leq 999$ **Input Format:**

The input consists of a single integer n .

Output Format:

If n is a single-digit number, print its square.

If n is a two-digit number, print its square root (rounded to two decimal places).

If n is a three-digit number, print its cube root (rounded to two decimal places).

Else print "Invalid".

1.1.3. Age and Salary Calculation

Write a Python program that reads the birth date and salary of employees.

Input Format:

The input consists of:
A string representing the birth date of the employee in the format *DD - MM - YYYY*.
A floating-point number representing the salary of the employee in rupees.

Output Format:

The output should include:
The age of the employee.
The salary of the employee in dollars.

Note:

1INR=0.012USD

Sample Test Cases

```
birthDate... Submit
1 from datetime import datetime
2
3 def calculate_age(birthdate):
4     date_object = datetime.strptime(birthdate, "%d-%m-%Y")
5     today = datetime.today()

1.2.1. Pass or Fail

29:27

Write a Python program that accepts the number of courses and the marks of a student in those courses.

The grade is determined based on the aggregate percentage:

- If the aggregate percentage is greater than 75, the grade is Distinction.
- If the aggregate percentage is greater than or equal to 60 but less than 75, the grade is First Division.
- If the aggregate percentage is greater than or equal to 50 but less than 60, the grade is Second Division.
- If the aggregate percentage is greater than or equal to 40 but less than 50, the grade is Third Division.

Input Format:

The first input will be an integer n , the number of courses.

The second input will be n integers representing the marks of the student in each of the n courses, separated by a space.

Output Format:

If the student passes all courses:

Sample Test Cases

1.2.2. Fibonacci series using Recursive Function

02:10

Write a Python program to find the Fibonacci series of a given number of terms using recursive function calls.

Expected Output-1:

Enter terms for Fibonacci series: 5
0 1 1 2 3

Expected Output-2:

Enter terms for Fibonacci series: 9
0 1 1 2 3 5 8 13 21

Instructions:

- Your input and output must follow the input and output layout mentioned in the visible sample test case.
- Hidden test cases will only pass when users' input and output match the expected input and output.

Sample Test Cases

+

fib.py

Submit

```
1 def fib(n):
2     if n <= 0:
3         return 0
4     elif n == 1:
5         return 1
6     else:
7         return fib(n-1) + fib(n-2)
8
9 n=int(input("Enter terms for Fibonacci series: "))
10 for i in range (n):
11     print(fib(i),end=" ")
```
